

Dear Parents/Carers,

Here are some suggested Maths websites that you might find useful:

Corbett Maths Primary 5 a day questions and answers at <https://corbettmathsprimary.com/5-a-day/>

It has different levels:

- Bronze level is generally suitable for Year 3
- Silver for Year 4
- Gold for Year 5/6
- Platinum level for more able mathematicians.

White Rose Maths Home Learning at <https://whiterosemaths.com/homelearning/>

This has daily lessons and a short video to guide pupils and parents through the activity sheet and then the answers. Simply click on the year group your child is in for access to the resources.

There are also parent friendly maths activities at <https://nrich.maths.org/13371>

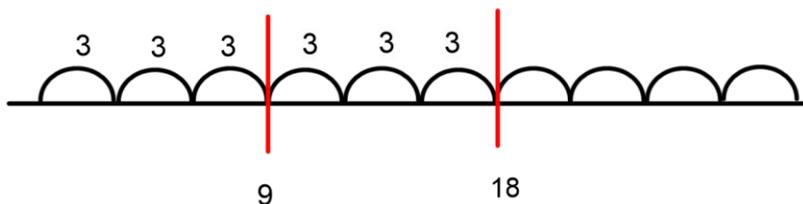

Below are some strategies to help with learning multiplication tables:

### **Maths activity: Times Tables**

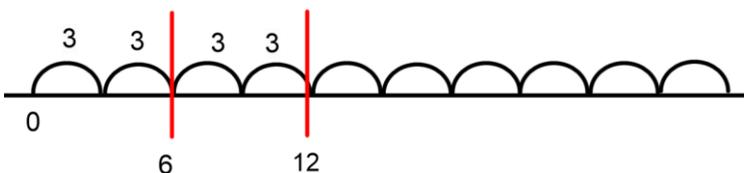

If you find it hard to remember your tables facts, these strategies can help you to find them quickly.

Remember your counting stick or draw a number line and use doubles and halves if you get stuck. I have shown some examples with the 3x table below. If you already know your 3x, you can use the same ideas with any table - as long as you know your doubles and halves!

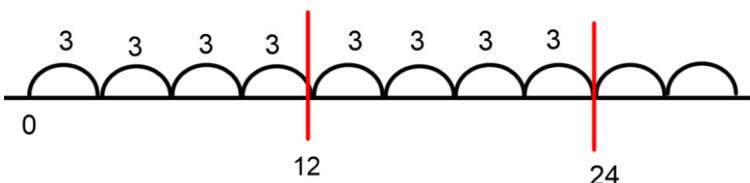

For example, you can double  $3 \times 3$  to find  $6 \times 3$ .

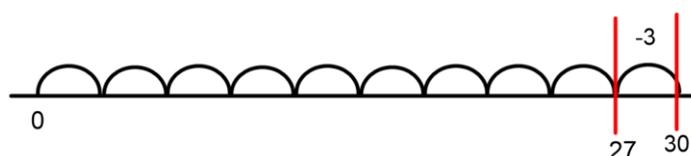

You can double  $2 \times 3$  to find  $4 \times 3$ .

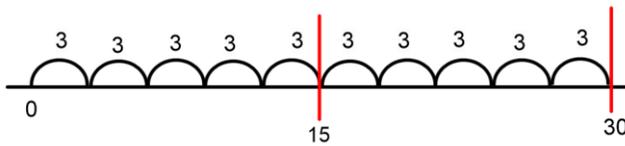

Double  $4 \times 3$  to find  $8 \times 3$ .

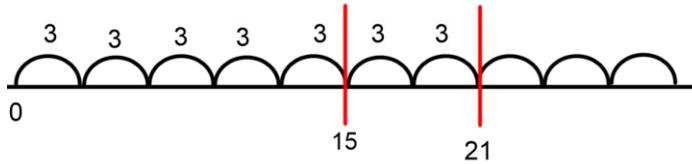

You can take 3 away from  $10 \times 3$  to find  $9 \times 3$ .

You can halve  $10 \times 3$  to find  $5 \times 3$ .

You find  $5 \times 3$  and add the double to find  $7 \times 3$ .

Other ideas: cut up bits of cards or paper and write the numbers from the  $3 \times$  table on each one. Put them in order, then put them face down to hide them. Say a fact (e.g.  $7 \times 3$ ) and ask child to predict the answer then turn it over. You can play this as a game, taking it in turns and scoring points for correct answers or speed. This can really help your child to build up their instant recall of the table they are working on.

You can also muddle them up and ask your child to rearrange them, put them in order and swap two, asking your child to spot which two have been swapped, or hide one and ask them to find which one is missing. They could do the same for you!

Remember, make sure your child is confident with one table before introducing another. When they think they are confident, use Emile or Maths Frame to check their recall or just test them yourself

Learn these rhymes to help you with your square numbers:

$3 \times 3$  - Three times three, remember the rhyme, and you'll know the answer is nine.

$4 \times 4$  If you are ever questioned by the queen, please tell her that four times four is sixteen.

$5 \times 5$  Five times five is twenty five, how good it is to be alive, high five!

$6 \times 6$  Abracadabra, magic tricks, six times six is thirty six.

$7 \times 7$  Seven kids in seven lines, add them up it's forty nine.

$8 \times 8$  Eight times eight is sixty four, push your (8 year old) sister out the door.

$9 \times 9$  Nine times nine is eighty one, run along and eat a bun.

$10 \times 10$  The easiest of all, it has to be said, ten times ten is one hundred.

We hope this helps with supporting you with Maths Learning at home.
